**NOTES ON « APODANTHES CASEARIAE » POIT.  
AND « PIOSTYLES CALLIANDRAE » (GARDN.) R. BR.  
(RAFFLESIACEAE-APODANTHEAE)**

par IDA de VATTIMO<sup>1</sup>  
(Botanic Garden of Rio de Janeiro).

In the present paper the male flowers of *Apodanthes caseariae* Poit. and *Pilostyles calliandrae* (Gardn.) R. Br. are described, since they are unknown to science till now. Moreover, *P. ingae* (Karst.) Hook. f. and *P. mexicana* (Brand.) Rose are considered as being identic with *P. calliandrae* (Gardn.) R. Br.

Examining the collections of *Rafflesiaceae* of the National Museum of Rio de Janeiro (R) and of the Herbarium on the Utrecht University (U) and the New York Botanic Garden (NY) the writer was able to find specimens of *Apodanthes caseariae* Poit. with male flowers, previously unknown for the whole genus *Apodanthes* Poit. The sample seen in R, collected by Dr. J. G. Kuhlmann in the State of Mato Grosso, Brazil, had well developed flowers and therefore was the basis for the description of the male ones. The specimens from U and NY, collected by Ynes Mexia in the Brazilian State of Minas Gerais, showed to have flowers with faded anthers and pollen shed.

The male flowers of *Pilostyles calliandrae* (Gardn.) R. Br. were also unknown up to date, but they could be detected in the material seen from R. Such specimens were gathered by Ernest Ule in the Brazilian State of Goiás.

Solms-Laubach's (1901) assumption that *P. calliandrae* (Gardn.) R. Br. is a synonymous of *P. ingae* (Karst.) Hook. f. was not credited by Ule (1815), who kept them as distinct species. According to him *P. ingae*, as well as *P. calliandrae*, grows on branches of a *Calliandra* Benth., not an *Inga* Scop., since the host, in every case, has twice pinnated leaves. It was impossible to have in hands the type of *P. ingae*, destroyed by war accidents in the Wien Natural History Museum, where it was deposited, but the comparison of the diagnosis and Karsten's picture (1856) with *P. calliandrae* samples permits to claim that they belong to the same

1. — The author is much indebted to Dr. Carlos T. Rizzini and Dr. Walter Mors for the revision and correction of the English text.

species. In short, this last name is a legitimate one and has priority of publication over *P. ingae*. In the present author's opinion *P. mexicana* (Brand.) Rose is also a synonymous of *P. calliandrae* (Gardn.) R. Br.

The fact that *P. mexicana* have been described in its original diagnosis as possessing tepals with erose margins and that *P. calliandrae* is said to show tepals with entire margins cannot serve to make them distinct entities; indeed, samples of the latter, examined from R, have proved to bear tepals with margins ranging from almost entire to irregularly crenulate-dentate, which include notched forms.

Follow the descriptions of the male flowers of *A. caseariae* Poit. and *P. calliandrae* (Gardn.) R. Br., with a revision of the male blossoms diagnosis.

*Apodanthes caseariae* Poit. in *Ann. Sc. Nat. Iser.* T. III (1824), p. 422, Atlas tab. 26; R. Brown in *Trans. Lin. Soc. London*, XIX (1845), p. 247; S.-Laubach in *Mart. Fl. Flores globosi vel subglobosi, primum albi demum rubelli, triverticillati. Verticillus inferus bracteis oppositis duobus, squamaeformibus, integris vel apice trilobatis; verticillus medianus calycinicus tetramerus, sepalis quatuor, margine integris vel irregulariter crenulatis, ovatis vel supra semsim attenuatis, basi ovario vel receptaculo adnatis; verticillus superus corollinus tetramerus, petalis margine irregulariter crenulatis, ovatis superne rotundatis, inferne cordatis basi appendiculatis vel fere orbicularibus, basi asymmetricis, expansione laterali unica, cum lobis verticilli mediani alternis munitus. Flos foemineus-Ovarius semi-inferus ellipsoideus, unilocularis, loculo fere quadrangulato, ovulis per totam parietem loculi sparsis. Stylus distinctus vel semsim in discum transiens, vertici obscure quadrisulcatus. Discus petalis elapsis cicatricibus punctiformibus quattuor simplicibus munitus. Stigma annulare. Flos masculus-Columna genitalis brevis, pileo breve hemisphaerico corona pilis glandulosis circumdato praedita, infra pileum seriebus duobus quaeque antheris circa 19 annulatim dispositis, basi disco lato convexo margine angulato circumdata.

Flores unisexuales e cupula corticis hospitis erumpentes, 1-3 mm alti et lati, globosi vel ovidei, verticillis tribus tetrameris, verticillo infero bracteis quattuor vel tres margine subintegris vel irregulariter crenulatis dentatis vel erosionis, rubro-vinacei, ovati, basi ovario (flos fem.) vel receptaculo (flos masc.) adhaerentibus; tepali verticilli mediani rubro-vinacei, ovati, valvares, inter se tegentes latiore parte vel parum remoti, basi ovario vel receptaculo usque sub marginem disci adhaerentes, istinc liberi, sub illis verticilli superi terminati; tepali verticilli superi apicem versus albi, superne rotundati ad basin angustati, ad marginem disci insidentes, imbricati, sub apicem columnae vel styli terminati vel eos superantes. Flos foemineus-Stylus conicus, apice rotundato, stigmate lato annulario, sessile super discum conicum superiore parte ovarii constitutum. Ovarius semi-inferus, angulatus unilocularis, ovulis 3-5 placentis parietalibus irregularibus vel irregulariter per totam parietem ovarii dispositis. Flos masculus-Columna genitalis media, basi disco angustato vel subnullo depresso circumdata, diametrum pilei aequante vel parum ampliore. Pileus latus, altus, apice rotundato, margine corona pilis glandulosis pyriformibus munitus, circa dimidia parte columnae vel amplius constitutus. Antherae duobus seriebus completis vel incompletis raro in una serie incompleta, quaeque usque ad 22 antheris munita.
